

The patented Jet Edge Dual Pressure Valve is a remotely mounted valve that allows waterjet operators to control water pressure independently of the intensifier pump. This enables operators to run a number of tables or cutting stations at various pressures.

In low-pressure piercing applications, the Dual Pressure Valve can increase productivity by allowing operators to reduce and raise water pressure without having to wait for the intensifier pump to drop to the lower pressure or rise to the higher pressure.

The Jet Edge Dual Pressure Valve will operate with any manufacturer's pump, cutting head, or cutting system, and is fully configurable for pressure change ratios.

Connection points are standard 60,000 psi-type. The Dual Pressure Valve is pneumatically operated and must be used in conjunction with another normally closed on/off valve or cutting head.

*"The Dual Pressure Valve is amazing. Nobody else has anything comparable on the market. It saves wear and tear on all the components."*
