

The Jet Edge Slitter is specifically designed for slitting, edge trimming, and cross-cutting. The Slitter is ideal for cutting materials such as paper, fabric, diapers, insulation, webbing, rubber and plastic. It can be customized.

### Construction

Jet Edge waterjet slitting stations are mounted to C-frames and consist of cutting nozzles controlled by the patented OmniJet® high-pressure on/off valve. One nozzle is primary and another is used as a back up, so maintenance can be performed while still in operation. A Jet Edge intensifier pump supplies up to 60,000 psi (4,100 bar) water to the cutting nozzles. Jet Edge offers manual or programmable positioning, standard and custom-designed systems.

### Standard Features

- Manual or programmable positioning
- Programmable Slitter features independent cutting stations with redundant heads.
- Individual "Z" assemblies allow adjustment in each cutting head's distance from the material.
- Valve Bank allows selection of which cutting heads are used.
